Homework

In the first lesson about records we used a simple ASP.NET Core application for listing the speakers.

1. Open solution for Module 2 and go to the **Dotnetos.Conference.WebApi** project.
2. Use your knowledge about init-only properties, records, inheritance, and (de)construction to rewrite the flow of retrieving speakers from the repository.
3. Your changes should not introduce a breaking change to the web-api JSON contract. After the refactoring, the **speakers** endpoint located under **https://localhost:5001/speakers** should return the same data as now.

There is no single solution to this task. Experiment, be creative, and try to check how much you know about the records.
